

# Elements of Reporting to Your Enterprise Board on Sustainable IT

As an IT leader, you're continually looking for ways to deliver more with less, and technology plays a crucial part in achieving this goal. With increasing global focus on achieving sustainability outcomes, this focus on efficiency and cost savings now includes a strategy for making enterprise technology and its usage more sustainable.

Here are 5 essential steps for reporting on your sustainable IT efforts to your corporate board.

-  Clearly map out how sustainable IT practices align with the company's overall sustainability goals and help reduce costs.
-  Highlight the measurable benefits of these initiatives beyond cost savings, such as improved operational efficiency, reduced carbon footprint, favorable talent recruitment and retention, and positive brand image.
-  Implement a data-driven digital employee experience (DEX) solution that can capture endpoint device energy usage across your IT estate and enable you to adopt a need-based procurement strategy in order to extend the life of your IT assets.
-  Identify the potential consequences associated with the lack of sustainability in your IT operations (e.g., regulatory risks, reputational risks, and operational risks).
-  Address the future by showcasing how the company's IT operation is forward-thinking and prepared for the changes ahead by highlighting upcoming trends and known requirements such as the Corporate Sustainability Reporting Directive (CSRD).
